

ASync 2026

HACKATHON IDEA SUBMISSION

- **Team name:** VIBKED
- **Team lead name:** Mayank Rathi
- **USN of team members:** 1) 1MS26CS204 - T
2) 1MS26AD049 - T
- **Email ID and phone number of team lead:** mayankrtb11@gmail.com & 8144160416
- **Track chosen:** Sovereign AI

What problem are you solving?

- **Problem Statement Explanation:** We are building an AI you actually own — runs locally, knows your documents deeply, and can take real actions through MCP tools.
- **Who is affected:** People who are concerned about keeping their data local.
- **Why it matters:** Every AI tool on earth (ChatGPT, Perplexity, Claude, Notion AI) sends your data to someone else's servers

What is your solution?

- **Solution description:** It transforms personal documents and conversations into a searchable knowledge base, remembers important context across sessions, reasons over that knowledge using local LLMs, and can take actions through MCP tools — without sending private data to external AI servers.
- **How it works:** Users can upload PDFs, notes, and text files directly into VIBKED. The system processes and organizes this information locally, making it easy to search and retrieve when needed. When a user asks a question, VIBKED finds the most relevant information from their documents and previous conversations, then uses a local AI model to provide a contextual answer.
- **Key features:**
 - Data: Upload PDFs, Markdown, or text files → they are automatically processed and stored.
 - Knowledge: ChromaDB searches your files to find the most relevant information.
 - Memory: Mem0 remembers conversations and useful facts across sessions.
 - Reasoning: Ollama + Llama 3.1 8B understands the question and creates the answer.
 - Action: MCP tools let the AI search the web and write files, making it an agent instead of just a Q&A chatbot.
- **Expected outcome:** VIBKED helps you make sense of all the information you already have. Instead of digging through files or starting from scratch every time, you can ask VIBKED questions + MORE PRIVACY.

What makes your idea different?

- **What is different:** The privacy of the users data being handled locally, so that secretive files do not make it to the internet
- **Current alternative:** Users have to go for AI tools online, like Chatgpt, Perplexity, Claude.
- **Why it matters:** To protect the users from potential data leaks from AI servers and models to be trained on it and the idea of owning a software rather than just being fixed to the subscription model.

Can you build it?

- **Tech stack:**

Backend

pypdftavily-python

Fastapi

Uvicorn

python-multipartchromadb

aiollama

Frontend

react + vite + tailwindcss

react-dropzone

- **MVP scope:** The core version of VIBKED will be a local AI knowledge assistant that allows users to upload and interact with their personal documents securely.
- **Demo-day deliverable:** VIBKED will have a working local document ingestion pipeline for PDFs, Markdown, and text files, along with a chat interface that can answer questions using the uploaded knowledge base

What will you achieve?

- **Expected impact:** VIBKED is designed for anyone who works with a large amount of personal or work related information, such as students, researchers, developers, and professionals.
- **Success metric:** The main success metric will be whether VIBKED can reliably answer questions using the user's uploaded documents and provide the correct source for each answer.
- **Demo outcome:** By the end of the demo, judges should see VIBKED working as a complete local AI knowledge assistant. They will be able to see documents being uploaded and processed, ask questions about the uploaded information, and receive answers grounded in those documents with relevant sources.
